**I. Amendments to the Claims**

Cancel claims 1-19

New Claims 1-8 have been added as follows:

**Listing of Claims:**

Claim 1. A coupling device for converting a below ground potable water well installation to an above-ground installation, the device comprising;

a housing having a first end region extending into the upper end of a below-ground well casing and a second region having an opening which is dimensioned to receive a lower end of a well casing extension;

gasket means located adjacent the first opening which includes a gasket member which extends along and engages the inner surface of the well casing and an exterior flange which extends along and engages the outer surface of the well casing providing a seal against both the inner and outer surfaces of the well casing;

gasket means located adjacent the second opening for sealing the respective connections between the housing and the well casing extension; and

a central region including a passage to receive a well line adaptor there between.

Claim 2. A device as defined in claim 1 where the gasket means located adjacent the second opening includes a passage which is aligned with the passage in the housing to receive the well line adaptor.

Claim 3. A device as defined in claim 1 wherein the housing includes a gasket receiving chamber of an increased diameter relative to the diameter of the second opening.

Claim 4. A device as defined in claim 3 wherein the housing is formed from a one piece member.

Claim 5. A device as defined in claim 4 wherein the housing has an expanded central region with a diameter sufficient to accommodate the lower end together with the gasket member between the lower and upper end wherein the upper and lower regions of the gasket receiving chamber include annular surfaces which are separated by a distance sufficient for the gasket sleeve to fit there between.

Claim 6. A device as defined in claim 5 where the upper gasket further includes a first inner surface which is radially inwardly tapered from the second opening toward the upper seating surface and wherein the lower gasket further includes an inner surface region which is radially inwardly tapered from the first opening towards the lower seating surface.

Claim 7. A method for converting a below-ground potable water well installation to an above-ground installation, the below-ground installation being of the type having a well casing with an upper end positioned below the ground surface and located within a well chamber, comprising the steps of:

- a) accessing the well chamber and opening the upper end of the well casing;
- b) accessing a well pump line in the well casing which is connected, by a fluid joint, with a water supply line extending in the pump chamber from a neighbouring water delivery location;
- c) disconnecting the joint and isolating the well pump line;
- d) providing a coupling member, having;
  - a housing having a first end region extending into the upper end of a below-ground well casing and a second region having an opening which is dimensioned to receive a lower end of a well casing extension;

gasket means located adjacent the first opening which includes a gasket member which extends along and engages the inner surface of the well casing and an exterior flange which extends along and engages the outer surface of the well casing providing a seal against both the inner and outer surfaces of the well casing;

gasket means located adjacent the second opening for sealing the respective connections between the housing and the well casing extension; and

a central region including a passage to receive a well line adaptor there between.

e) preparing the upper end for engagement with the coupling member;

f) orienting the first opening of the coupling member to a position adjacent the upper end and positioning the housing on the upper end to bring the upper end against the first seating surface and a first gasket;

g) installing a pump line adaptor through a passage formed in the coupling member;

h) installing the water supply line to the pump line adaptor;

i) selecting a well casing extension member of a length which, when added to the predetermined spacing between the seating surfaces in the coupling member, will extend above the ground surface;

j) orienting the lower end of the well casing extension adjacent the second opening and positioning the lower end in the second opening to bring the lower end against the second seating surface and lower gasket;

k) filling the well chamber with a suitable filling material around the coupling and well casing extension member; and

l) installing the well pump line to the well line adaptor.

Claim 8. A claim wherein a pump is attached to a lower end of the well pump line and step c (one side) includes a step of pulling the well pump line and the pump from the well casing.
